

## Rolfsan river, Sweden, 2005

New bridge over river and adjacent area decided as a conservation project by the road authorities. Aesthetical values important. Soil condition is sandy and running water up to 3 m/s, causing risk for erosion. For river bank protection we used both NAG C350 TRM and pre-vegetated coirbeds (KK-BED). Areas only temporary flooded are covered with coir ECB (KK-5). All area seeded and planted.
